

Release Notes for Version 7.0.2301

Feature	Type	Comments	Settings
Assisted Assembly	Fix	Fixed issue where a failed invoice save from assisted assembly "Item View" caused SPOT to crash.	
Assisted Assembly	Fix	Removed hourglass from the Split Reason dialog during 'Split Remaining Pieces' at assisted assembly.	
Assisted Assembly	Addition to Existing Feature	<i>As a SPOT user, I would like to override the company splitting settings on the store level.</i> Added a store-level override for splitting settings.	New settings: Store Settings > Mark-in Settings > SplittingSettings Selection - select from "Use Company Settings" and "Use Store Settings". The default is "Use Company Settings", which will cause the system to continue with the existing settings. If "Use Store Settings" is selected, then the next view "SplittingSettings" must be filled out to meet the desired criteria.
Assisted Assembly	Change	<i>As a SPOT user, I would like assisted assembly to scan an item a second time to remove it from assembly bay</i> Implemented the option to remove an item that has been scanned into assisted assembly. The first item scan prompts with a red screen and a "Rescan to Cancel" prompt. The second item scan will remove the item from assisted assembly. If the system is able to add an order with an item scan, and if the removed item is the only remaining item on an order, SPOT will remove the order itself.	New setting in the Assisted Assembly Profile-> Rescan Item to Remove (check to enable).
Credit Cards	Fix	Updated certain CC functions: 1) Changed how in-mem copies of CC Encryption Keys are contained, designed to marginally enhance security and remove multiple calls to SPENcryptLib. 2) Failure to unencrypt CC initially will result in reattempts using key fragments. 3) Every Customer CC in-mem copy of data now includes "ID" attribute. 4) Failure to unencrypt CC entry will cause CC entry to carry a payload attribute of "Error", so we can better identify when this occurs. 5) Failure to unencrypt CC entry will show up in the SPOT error log. 6) Added Error log entry if CCOF does not unencrypt within the first pass 7) Implemented CCOF Removal of entries explicitly specified by events in frmCustomer.	
Credit Cards	Fix	Updated message to reflect the fact that the transaction was reversed, so it will now read "Reversed/Declined", as per the Ocius integration guide.	

		Updated Ocius3 interface to more directly address the issue of a non-tokenized CCOF entry being submitted. Since this is no longer supported by the interface, the system will now raise a direct error if this is attempted.	
Credit Cards	New Feature	<p>Enhancements to CCOF Autoupdater</p> <p>New setting "Enable Token Card Data Update", will activate these changes:</p> <ol style="list-style-type: none"> 1) Added "Update CC Token" button to the Customer View, AR/CC tab. This may be invoked when the prompt for an expired card is displayed. 2) Updated the Statement Wizard and A/R Auto-Payments views to show the "Auto Pmt" with a background color if the CCOF entry is expired: Red for expired non-tokenized CCOF entry, yellow for expired tokenized CCOF entry. The yellow entries will attempt to submit to the processor. 3) When prompted to update the expired CCOF entry for a customer, declining to do so will not result in the disabling of that entry. 4) CC Batch will better handle CCOF tokens and expired tokenized CCOF entries. 5) Kiosk Prepay will now mark expired CCOF tokens with a red check-mark, and will attempt the transaction. 6) Route Post orders will now mark expired CCOF tokens with a red check-mark, and will attempt the transaction. 	Added new setting "Company > Credit Card Settings > Enable Token Card Data Update".
Credit Cards	New Feature	<p>As a SPOT user, I would like a screen to manage expired CCOF</p> <p>Added a new screen (Menu > Credit Cards) that will allow a user to view all customers with expired (or almost expired) credit cards and update. If the automatic token update feature is enabled, then the system will also allow this update to be done in batch.</p>	
Email	Fix	Fixed - Email Notifier Process Interceptor - DUETODAY not functioning correctly.	
Email	Fix	<p>As a SPOT user, I would like the ready order email scheduler to support the UK</p> <p>Order ready emails sent from SPOT Scheduler Service were showing dates in US format</p>	
General	Fix	Fixed inadvertent issue in messaging (introduced in 7.0.2222) where message view would crash if the user was not assigned to a primary store. This is an uncommon case.	
Hotels	Fix	Invoice mode adjustments in hotel orders were not applying to subsequent orders if the Split button was used in the markin screen.	
HSL	Fix	Incremental modifier upcharges will now resolve to an amount in item view. Previously, modifiers which had an incremental upcharge would not show the resolved percentage and could potentially be saved with an HSL as a 0% upcharge.	
Issue Manager	Fix	Fixed - Inquiry Manager, "Resolution" tab, the "Estimated Amount" and	

		"Difference" fields were allowing user input. Note that the "Estimated Amount" field is copied from the "Cust. Est. Cost" field in the "General" tab, and should not be editable.	
Markin	Fix	Quick tickets generated by the kiosk are now fully completed. Previously, auto-adjustments, auto-coupons, and charity program information were always empty, even if those settings were configured.	
Pickup	Change	As a SPOT user, I would like the non-cash payment fee to be charged per payment instead of per visit The non-cash payment adjustment will now work per payment session instead of per visit.	
Pickup	Addition to Existing Feature	As a SPOT user, I would like a zero priced order to be able to be finished from pre-pay. Users could not finish in the prepay screen if the only orders present were zero-priced Priced Quicks.	
Pickup	Addition to Existing Feature	As a SPOT user, I would like the ability to enable marketing at the receipt print/email prompt. "Company Settings > Marketing Settings > Prompt for Marketing Opt-in" added as a new setting, which will enable clerks to opt the customer in to marketing e-mails when the customer gives his/her e-mail address to receive an e-mail receipt	Company Settings > Marketing Settings > Prompt for Marketing Opt-in
Pickup	Addition to Existing Feature	As a SPOT user, I would like SPOT to void orders when I cancel prepay The setting "Store Settings > Cashier Settings > Void Priced Quicks on Prepay Cancel" has been added. This will allow Priced Quicks to be voided automatically if the clerk cancels out of the prepay screen when prepay of Priced Quicks is enforced.	Store Settings > Cashier Settings > Void Priced Quicks on Prepay Cancel
Priced Quick	Fix	If the "Credit Card" tender was configured to refund using cash credit, overpaid detailed orders were still crediting the credit card instead of issuing cash credit.	
Printing	Fix	"Disable Print Visit" customer option was not being honored if the customer prepaid Priced Quick or detailed orders.	
Printing	Fix	SPOT will now honor the PrintAsyncDisable system property (either via VTC or command-line).	SPCM->Edit VTC->Add System Property "PrintAsyncDisable", value=1
Printing	Fix	Items from non-voided invoices were not being counted in a visit ticket in which the first invoice was voided	
Printing	Addition to Existing Feature	As a SPOT user, I would like to avoid printing register receipts unless they spend over X amount. "Workstation Settings > Cashier Settings > Print Register Receipt - Threshold (CC)". This setting provides the ability not to print a register receipt for credit card transactions unless the payment amount reaches the specified threshold.	"Workstation Settings > Cashier Settings > Print Register Receipt - Threshold (CC)"

Printing	Fix	Like items in Priced Quicks were being improperly separated when the invoices were saved, resulting in long printed tickets.	
Printing	Fix	The "TotalCoupon" data node in receipt document templates was not working on a receipt reprint.	
Reports	Addition to Existing Feature	Added - Reports Gallery > Customer > Top 100 Customers - Brands. New report that shows the top 100 customers for the selected stores for sales during selected date range and displays their top 5 brands.	
Setup	Change	Updated SPOT to perform certain initialization tasks only as needed (e.g., when configuration changes are modified). This results in faster startup time.	
SPOTMap	Change	Updated SPOT to load mapping services only as needed. This results in faster startup time.
